

Leidos introduces new AI platform to find, fix cybersecurity vulnerabilities

July 29, 2026

RESTON, Va., July 29, 2026 /PRNewswire/ -- Government and commercial organizations could soon thwart potential cybersecurity threats by deploying [Parcata](#)™, a proprietary platform [Leidos](#) (NYSE: LDOS) has developed to autonomously find and fix software vulnerabilities.

This next-generation, model-agnostic tool harnesses a diverse set of large language models to accelerate vulnerability detection in first and third-party software and can patch zero-day vulnerabilities in real time.

"The use of AI by cyber adversaries has changed the game. We must detect and remediate before a breach," said Jason O'Connor, president of Leidos Intelligence. "Developed by our Kudu Dynamics team, with technology validated through DARPA's AI Cyber Challenge, Parcata will help organizations stay ahead of evolving threats. This tool will make sense out of the chaos and ensure the mission isn't dependent on any single frontier model."

The platform has demonstrated its capabilities through recent internal technical exercises and is being executed against Leidos code before it is deployed to mission environments.

This work aligns with Leidos' NorthStar 2030 strategy and its focus on AI-enabled capabilities and effects at operational scale across dynamic warfighting environments.
